VACCINE INFORMATION

Research has shown that the immunity triggered by some vaccines actually last longer than a year and most universities are recommending tailoring schedules to maximize each patient's immune responses and minimize potential complications. For our recommended vaccination schedules please see links below.

The doctors at Atascadero Pet Hospital & Emergency Center are constantly researching the latest in schedules and vaccines to keep your pets safe. Some vaccines chosen by our facility are given in the form of nose drops or special jet spray to avoid injections and some are specially produced to maximize effectiveness and safety. The risks from vaccines are generally outweighed by the risks of diseases.

Vaccines generally have few side effects except for occasional discomfort at injection site or short term sluggishness, but please call us immediately if you notice any of the following after a vaccination:

- Swelling to face, small bumps
- Vomiting
- Difficulty breathing
- Collapse

Note: Just as we see a doctor for a physical annually in an attempt to detect any early signs of possible problems, so should our animal companions. We feel that preventative medicine is an integral part of maintaining any healthy, happy life. This begins with wellness examinations, vaccinations and parasite control. Our doctors will perform a full head to tail examination prior to administering vaccinations and can answer any questions you may have at that time.
